                           The invention relates to an isolated B7-like (B7-L) polypeptide (I). I polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Otsuki T, Wakamatsu A, Sato H, Ishii S; Hio Y, Otsuka K, Nagai K, Irie R, Tamechika I; Otsuka M, Nagahari K, Masuho Y;

The invention discloses a polymucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel collypeptides. Also claimed is a polymeptide encoded by the polymucleotide, on antibody binding to the polympetide or peptide or its partial peptide, an antibody binding to the polympetide or peptide of the polymucleotide, immunologically assaying the polympetide or peptide of the polymucleotide by contacting the polympetide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymucleotide in an expressible manner and an antisense polymucleotide. The oligonucleotide is useful as a primer for synthesising the polymucleotide in an expressible manner and an entised and many disease-related proteins are useful as pharmaceutical agents and many disease-related completed in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of genes many membrane proteins, signal transduction-related proteins, cranscription-related proteins, signal transduction-related proteins, cranscription-related proteins, disease-related proteins are nuclein to the activity and as a procession of the encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, rancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to the activity or expression of the encoded protein to the activity or expression of the invention where the activity or expression of the invention where the activity or expression of the invention where the activity or expression of the invention where the activity are the activity or an expression of the invention where the activity or an expression of the invention where the activity or expression of the invention where the activity or expression of the invention where the activity or expression of the invention where the activity or expression of the invention where the activity or sequence presented is a CDNA of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. (AMGE-) AMGEN INC.

Welcher AA, Sarmiento UM, Schultz HJ, Chute HT;

WPI; 2002-130881/17. P-PSDB; AAU75542. New B7-like polypeptides, polynuclectides and their modulators, useful for diagnosing, preventing and treating reproductive, immune and proliferative disorders, e.g. cancer and arteriosclerosis.

Claim 1; Fig 3; 135pp; English.

The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polymucleotide encoding it and antibody against (I) are polypeptide, polymucleotide encoding it and antibody against (I) are conditions including reproductive disorders (e.g. infertility, an iscarriage, preterm labour and delivery and endometriosis) and miscarriage, preterm labour and delivery and endometriosis) and conditions including the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of growth and maintenance of cancer cells based on the observation of cancer including seminal vesicle more regulators of (I) are useful for the treatment of polypeptide. Honce modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, ce seticular cancer and cancers of flammatophoryce response in callograft transplantation, graft versus host disease, T-cell dependent B-cell mediated diseases and autoimmune diseases. Br. molecules are useful for alleviating the symptoms associated with diseases involving chronic cell mediated diseases and autoimmune diseases under a systemic cell dependent B-cell mediated diseases and autoimmune diseases under a systemic of immune cell dysfunction or to treat autoimmune diseases under a sinflammatory bowel disease (Crohn's diseases such as inflammatory bowel disease (Crohn's diseases under also useful as immune cut as inflammatory are also useful as immune cut and organ transplantation or to prolong graft survival. Br. Complexite are also useful for disponsts and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of Br. polypeptides are also useful as immune cell for treatment of alleviation decorporation, nephropropathies (e.g. gloemerloaders such as decorporation or the prolong gravis and pror treatment of alleviation of treatment of alleviation, such propagates of pneumopathies (extrinsic alveolitiss), vasculop

The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide. Felated disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and confiderative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (I) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, testicular cancer and cancers of haematopoietic system. B7-L polypeptide C0 pathway can be manipulated to regulate cytotoxic T1-puphocyte response in comparate diseases and autoimmune diseases. T-cell dependent B-coll mediated diseases and autoimmune diseases involving chronic

immune thrombocytopenic purpura and psoriasis, multiple sclerosis, diabetes, immune thrombocytopenic purpura and psoriasis, chronic inflammatory disease such as inflammatory bowel disease (Crohn's disease and ulcerative colitis), Grave's disease, Hashimoto's thyroiditis and diabetes mellitus. They are also useful as immunosuppressive agents for chabetes mellitus. They are also useful as immunosuppressive agents for bone marrow and organ transplantation or to prolong graft survival. B7-L molecules are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and vascular restenosis. Antagonists of B7-L polypeptides are useful for transfusions, and for treatment of alleray, asthma and hypersensitivity creations, nephropathies (eg. glomerulomephritis), skin disorders pneumopathies (extrinsic alveolitis), vasculopathies, solice disease, consents and unapathies (extrinsic alveolitis), vasculopathies, coeliac disease, consents and unapathies (allera). ö 157 150 217 210 277 270 337 330 397 390 457 450 517 such as systemic 510 577 570 637 630 697 069 750 817 757 gravis, and lymphoproliferative disorders such as multiple myeloma. polypeptide, polynucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders of e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders: Antibodies, soluble proteins comprising comprising comprising or extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in careful for enhancing the immune response to tumours. (I) plays a role in seminal vesicle hyperplasia in transgenic mice overexpressing B7-L collypeptide. Hence modulators of (I) are useful for the treatment of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L coll dependent lest cancer and cancers of haematopoletic system. B7-L polypeptide collogisal ransplantation, graft versus host disease, T-cell dependent B1-C plathwy can be emaipulated to regulate cytocoxic T-tymphocyte response in allograft transplantation, graft versus host diseases useful coll mediated diseases and autoimmune diseases. B7-L molecules are useful coll mediated diseases and autoimmune diseases. B7-L molecules are useful coll mumune cell dysfunction or to treat autoimmune diseases such as sixlammatory bowel diseases (Crohn's diseases such as inflammatory bowel disease (Crohn's diseases such as inflammatory bowel disease (Crohn's diseases useful for diagnosis and treatment of diseases and clabetes mellitus. They are also useful for diagnosis and treatment of diseases involving abnormal cell proliferation, including arteriosclerosis and transplantation of toxic shock syndrome or allosenstitisation due to blood transfusions, neptropathies (e.g. glomenlopephics) collopephics are also useful for diagnosis and treatment of diseases involving and pemphigoid), endocrinopathies (Grave's diseases) control dependence exprise collopephics are also useful for diagnosis and treatment of diseases (compliant and pemphigoid), endocrinopathies (e.g. g

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 186.66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Conservative
```

involving abstrant procein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AsS64197-AsS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in ftp.wipo.int/pub/published_pct_sequences

ACH16130

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Claim 1; SEQ ID NO 28160; 103pp; English.

biodiversity.

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polymucleotide comprising any one of 38043 CDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypetide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for are useful in diagnostics as expressed sequence tags (EST) for informacis, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is one of the 38043 isolated CDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence. html?DocID=20030073623

```

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe breast. The probes are useful for a nucleic acid expressed in the human staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast cancer, disorders of development, inflammatory diseases of the breast undours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention isosful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

growtn and maintenance or cancer cells based on the observation of seminal vesicle hyperplasia in transgenic mice overexpressing B7-L polypeptide. Hence modulators of (1) are useful for the treatment of cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cefeticular cancer and cancers of haematopoietic system. B7-L polypeptide cancer including seminal vesicle cancer, lung, brain, breast, ovarian, cefesticular cancer and cancers of haematopoietic system. B7-L polypeptide cancer including maintained reseases. B7-L molecules are useful ceforal diseases and autoimmune diseases. B7-L molecules are useful cer alleviating the symptoms associated with diseases involving chronic immune cell dysfunction or to treat autoimmune diseases such as systemic immune thrombocytopenic purpura and psoriasis, chronic inflammatory companies each as inflammatory bowel disease (Crohn's disease and disease and collitis), Garave's disease, thathimoto's thyroiditis and diseases mellitus. They are also useful as immunosuppressive agents for dispetes mellitus. They are also useful as immunosuppressive agents for conclecules are also useful for diagnosis and treatment of diseases and colliers are useful for vascular restenosis. Antagonists of B7-L polypeptides are useful for vascular restenosis. Antagonists of B7-L polypeptides are useful for cansingopathies (extining alleray, asthma and hypersensitivity reactions, nephropathies (ey. glomerulomephritis), skin disorders consummant, thrombocytopenias, Gullaain-Barre syndrome and myasthenia canaemia, thrombocytopenias, Gullaain-Barre syndrome and myasthenia canaemia, thrombocytopenias, Gullaain-Barre syndrome and myasthenia canaemia, thrombocytopenias, Gullaain-Barre syndrome and myasthenia canaemia, thrombocytopenias, Gullaain-Barre syndrome of mouse B7-L_ml
                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated B7-like (B7-L) polypeptide (I). The polypeptide, polypucleotide encoding it and antibody against (I) are useful for treating B7-like polypeptide-related disease, disorders or conditions including reproductive disorders (e.g. infertility, miscarriage, preterm labour and delivery and endometriosis) and proliferative disorders. Antibodies, soluble proteins comprising extracellular domains and other regulators of B7-L polypeptides are useful for enhancing the immune response to tumours. (I) plays a role in growth and maintenance of cancer cells based on the observation of
                                                                                                                                                                                 New B7-like polypeptides, polymucleotides and their modulators, ufor diagnosing, preventing and treating reproductive, immune and proliferative disorders, e.g. cancer and arteriosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1640-ABL1617) and the encoded proteins (ABB57737-ABR2072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mouse; B7-like protein; B7-L; antiinfertility; gynaecological; antitumour; cytostatic; immunosuppressive; antiarthritic; antirheumatic; antiinflammatory; dermatological; antipsoriatic; neuroprotective; antidiabetic; haemostatic; antityvoid; antiulcer; antiallergic; antidiabetic; nephrotropic; antibacterial; virucide; tumour; cancer; reproductive disorder; graft versus host disease; autoimmune disease; toxic shock syndrome; allergy; nephropathy; skin disorder; dendocrinopathy; lymphoproliferative disorder; gene; ss.
                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
PCR primers AAV99359-60 were used to amplify cDNA encoding the full length protein of a glial cell line-derived neurotrophic factor receptor expressed in GDNFR-gammal). The amplified product was subsequently cloned and acpressed in Baculovirus. GDNFR-beta shares high homology with GDNFR-neurotrophic factor (GDNF) and mediating with glial cell line-derived neurotrophic factor (GDNF) and mediating cell response to GDNF. The GDNFR with decreased activity of the respective polypeptides. They can be used for treating disorders associated for treating neurodegenerative diseases such as amyotrophic lateral

New Arabidopsis thaliana nucleic acid for identifying homologous genes, producing compositions that modulate the expression or function of its encoded protein, and mapping functional regions of protein.

Claim 1; SEQ ID NO 930; 49pp + Sequence Listing; English.

The invention relates to an Arabidopsis thaliana nucleic acid (I)

Comprising a sequence capable of hybridising under stringent conditions

C comprising a sequence capable of hybridising under stringent conditions

C of a sequence selected from any one of 999 sequences (ABN893233-ABN89221),

Given in the specification or its fragment. A polypeptide (II) encoded by

C (I), a transgenic plant (III) comprising an exogenous nucleic acid or a genetically modified cell (IV) comprising an exogenous nucleic acid or a modified cell (IV) comprising an exogenous nucleic acid, is

C useful in identifying homologous or related genes, in producing

C useful in identifying homologous or related genes, in producing

C useful in identifying homologous or related genes, in producing

C useful in identifying homologous or related genes, in producing

C useful in identifying homologous or related genes, in producing

C useful in identifying producing of its also useful in acroeming assays of various plant extains to determine the strains that

C screening assays of various plant strains to determine the strains that

C screening assays of various plant strains to determine the strains that

C screening assays of withstanding a particular disease or environmental

Stress. (II) and (III) are useful for screening of biologically active

C agents, e.g. fungicides, insecticides, etc., for elucidating biochemical

Stress. (II) and (III) are useful in improved methods of treating

C tops to prevent or treat disease. (II) are also useful in screening

C pathways. The screened agents are useful in improved methods of treating

C pathways. The screened agents that mimic or enhance the action of tolerance to environmental stress. (II) is also useful for identifying other mediators that enhance to which

C (III) is useful for identifying other mediators that may induce to particular plant, for identifying other mediators that enhance to environmental stress. (II) are apposible to a particular plant and of interest, for identifying productions

```
This sequence encodes a novel glial cell line-derived neurotrophic factor alpha-3 receptor (GDNF alpha-3). This protein can be used to treat e.g. neurodegenerative diseases (such as Parkinson's Disease, amyotrophic lateral sclerosis (ALS), spinal muscular atrophy (SNA), Huntington's Disease, Alzheimer's Disease, diabetic neuropathy), muscular diseases (including the muscular dystrophies) and nerve and muscle trauma and in diagnostic assays for such conditions
                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New factor alpha 3 receptor polypeptide and e.g. DNA and agonists - used to treat neuro degenerative diseases, muscular diseases and nerve and muscle trauma and in diagnostic assays.
that may affect the biological function of the gene or gene products. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=999909770445
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glial cell line-derived neurotrophic factor alpha-3 receptor; GDNF; treatment; neurodegenerative disease; Parkinson's Disease; ALS; SYA; amyotrophic lateral sclerosis; spinal muscular atrophy; nerve; trauma; Huntington's Disease; Alzheimer's Disease; diabetic neuropathy; muscle; muscular dystrophy; diagnostic; ss.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2, Application US/08864038A

Sequence 2, Application US/08864038A

Patent No. 601192

GENERAL INFORMATION:
APPLICANT: Kunio NAKASHIMA et al.
TITLE OF INVENTION: NOVEL POLYPEPTIDE GENE CDNA, VECTOR
TITLE OF INVENTION: CONTAINING SAID CDNA, HOST CELLS TRANSFORMED WITH SAID
TITLE OF INVENTION: VECTOR, POLYPEPTIDE PRODUCED THEREBY, METHOD OF PRODUCING
TITLE OF INVENTION: TO SAID POLYPEPTIDE, DNA ENCODING SAID POLYPEPTIDE AND ANTIBODY
TITLE OF INVENTION: TO SAID POLYPEPTIDE
NUMBER OF SEQUENCES: 4
